INDUSTRIAL VISIT

Course Title & Code: Energy Resources and Generation (3EP03)
Class: Second Year Electrical (Electronics & Power) Engineering
Semester: IV
Name of the Course Teacher: Mr. M. R. Chavan
Title of the Innovative Practice: Industrial Visit to Thermal Power Plant for Practical Exposure

---

Objectives/Goals of the Practice

The primary goal of organizing the industrial visit was to enhance students' understanding of thermal power generation, its components, and operational workflow through real-world exposure. The visit aimed to bridge the gap between theoretical studies and practical applications in power plant engineering.

Specific Objectives:

- To provide students with firsthand experience of large-scale electricity generation using thermal energy.
- To familiarize students with the functioning of major thermal power plant components such as boilers, turbines, generators, condensers, and cooling towers.
- To introduce students to power plant layout, instrumentation, control, and safety measures.
- To relate academic concepts in power plant engineering with industry practices.

Use of Appropriate Methods

To fulfil the above objectives, the following methods were employed during the visit:

- **Pre-Visit Orientation:** A briefing session was conducted to inform students about the thermal power plant, its significance, safety protocols, and areas of observation.
- **On-Site Guided Tour:** Students were taken around various sections of the plant, including the control room, boiler unit, turbine hall, ash handling unit, and cooling tower. Plant engineers explained the operational procedures, safety norms, and control mechanisms.
- **Interactive Q&A Session:** Students interacted with plant professionals to understand real-time challenges, maintenance strategies, and automation technologies in thermal power generation.
- **Post-Visit Debriefing:** After the visit, a discussion session was held to consolidate learnings and connect theoretical concepts with observations.

Significance of Results

- **Increased Practical Awareness:** Students gained practical exposure to how thermal energy is converted into electrical power, reinforcing their theoretical understanding.
- **Concept Reinforcement:** Observing systems like feed water cycles, flue gas treatment, and coal handling in real-time enhanced the comprehension of classroom topics.
- **Industry Readiness:** Exposure to real-world working environments and professional practices helped students better prepare for careers in the energy and power sectors.
- **Improved Curiosity & Engagement:** The visit sparked interest in power plant operations, motivating students to explore further in areas such as energy efficiency, pollution control, and system automation.
- **Application-Oriented Learning:** Students could connect the knowledge from subjects like thermodynamics, electrical machines, and instrumentation with actual industrial setups.

Industrial Visit of Second Year Electrical Engg. Students at MAHAGENCO, Paras
